

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of the claims in the application.

Listing of Claims:

- 1 1. (twice amended) A connector comprising:
 - 2 a hollow member having an open first end and an open second end joined by
 - 3 a bore extending through said hollow member having a first bore section and a
 - 4 second bore section that is stepwise reduced from said first bore section creating an
 - 5 annular shoulder therebetween, said second section tapering inwardly from said
 - 6 shoulder toward a third bore section;
 - 7 a sealing member receiver integrally formed into the connector and located
 - 8 within said second bore section near said third bore section;
 - 9 a sealing member seated within said sealing member receiver as said sealing
 - 10 member receiver is formed, said sealing member being compressed during formation
 - 11 of said sealing member receiver to at least partially protrude inwardly into said
 - 12 second bore section;
 - 13 wherein said hollow member has an elbow configuration with a bend
 - 14 between said first open end and said second open end; and
 - 15 a flange extending partially into said bore extending between a first corner
 - 16 of said bend to a second corner of said bend, whereby said flange prevents over
 - 17 insertion of a conduit.
- 1 2. (original) The connector of claim 1 further comprising at least one retaining
2 assembly located on one end of said hollow member.
- 1 3. (original) The connector of claim 2, wherein said retaining assembly is a barbed-type
2 retaining assembly formed on said hollow member adjacent said second end of said
3 bore.

1 4. (original) The connector of claim 3 further comprising a sealing member receiver
2 formed on said barbed retainer; and
3 a second sealing member seated within said sealing member receiver on said
4 barbed retainer, said second sealing member extending at least partially radially
5 outward of said barbed retainer to effect a sealing relationship with a conduit.

1 5. (original) The connector of claim 4, wherein at least a portion of said barbed retainer
2 is formed without a parting line.

1 6. (previously amended) The connector of claim 1 further comprising, a latch-type
2 conduit retaining assembly mounted on said hollow member at said first end and
3 including a retaining clip biased toward a lock position.

1 20. (cancel)

1 21. (previously presented) A connector comprising:

2 a hollow member having an open first end and an open second end joined
3 by a bore extending through said hollow member, wherein said hollow member has
4 an elbow configuration with a bend between said first open end and said second
5 open end; and

6 a flange extending partially into said bore and extending from a first corner
7 of said bend to a second corner of said bend, whereby said flange prevents
8 overinsertion of a conduit within said bore.
